

## How to boost your volume on android

[Continue](#)

### How To Increase Sound Volume in Android For Free

Built-in speakers can be a drag for most smartphone owners. The sound from those devices is rarely loud enough, and many times the audio quality is just as low. However, there are many different methods of improving your phone's sound level and quality, including headphone volume booster apps or even just pairing a solid set of headphones with your device instead of using more generic ones. Read: Best smartphones for audio in this article, we'll go over many of those methods. It's more than likely that at least one of these ideas, or maybe a combination of several of them, will help boost your smartphone's volume and audio quality. Always check your volume and other audio phone settings first. You might be amazed at how many people who own a phone don't go into their settings to see if they can tap a slider or other control to improve the audio. This simple move could help boost the volume. Just tap on the Settings app on your phone and scroll down to the Sound and vibration section. Tapping on that option will bring up more options, including a Volume selection. Then you'll see several sliders to control volume for many aspects of your phone. The media slider is the one you want to use to lower or increase the sound from audio and other media apps. Android owners can also check out some extra audio adjustments in the Sound and vibration section of the Settings. Scroll down to the bottom to check out the sound quality and effects selection. Tapping on that will bring up an Android equalizer, with several sliders that you can use to help improve the quality of your phone's audio. Note: Keep in mind that the exact path to these settings may differ depending on your device. Use a headphone volume booster app. Several apps are available in the Google Play Store that claim to boost the native volume of your smartphone. Most of these work pretty well. Our favorite is called Super Volume Booster from developer SoulApps Studio. It will increase the overall volume on your phone by as much as 200%. Read more: Best over-ear headphones. As we said, there are many volume booster apps in the Google Play Store, and you can browse through them right now to see if you can find one that will work on your phone. Increasing the volume of your phone's speakers using one of these apps can potentially damage the speaker's hardware in the long term, so you might want to try another method or use one of these booster apps in small doses. Make sure your speakers have as little dust as possible. Many, if not most, smartphone owners put cases around their device to protect them. However, some cases might likely block some of the sounds that come out of your phone. If that's what's happening, you might want to look into getting a new case that has a big enough opening for your phone's speaker. You might also want to look into cleaning the speaker grills on your phone. There are a few effective ways to do this, such as using compressed air to blow particles and other items out of the grills. An even cheaper method is to take any type of tape and stick it on the speaker grills. You then remove the tape from the grill, and hopefully, a bunch of dust and particles will come off with it. You can also use a paintbrush to dust off a phone's speaker grill. Finally, if you use headphones to listen to music or your favorite podcast, you might want to consider cleaning out the headphone jack (unless it's one of those newer phones that has ditched the traditional headphone port). This is pretty simple as well. Take a dry Q-tip, put it in the jack very gently, and then remove it to clean it out. Try better audio and music apps. While the settings in Android have their own equalizer settings, as we have shown earlier, there are also many other apps available for download that provide more advanced settings that could improve the audio quality of your phone even more. Remember that these third-party equalizer apps may or may not work with your specific phone, so proceed with caution. Some of our top choices for headphone volume booster apps include Equalizer FX and Music Bass booster. Go to a higher quality setting on your music streaming app if you use a music streaming service like Spotify, Apple Music, YouTube Music Premium, or Amazon Music Unlimited, you might not be getting the best audio experience when you use one of its smartphone apps. That's because many of them default to the lowest quality for streaming music. That's usually to protect users with limited data plans. However, if you want to get a headphone volume booster for those services, go into the settings section of their mobile apps. You should see sections dedicated to improving music quality over mobile networks. Change those settings to the higher quality options to get the best audio experience. You can also download songs from those paid services at the highest quality to listen to them without a network connection. Find the best headphones. Chris Thomas / Android Authority. This is perhaps the simplest way to get your phone's best headphone volume boost. It's also perhaps the most expensive. Purchasing high-quality in-ear or over-ear headphones can be a pricey move, but it may be worth it if you get the right product. There are quite a few to choose from, as you might imagine. Many of them are designed specifically to cancel out noise coming from outside the headphones, so you can be assured of the best audio experience. Connect your headphone to a portable DAC. Connecting a good set of headphones to a smartphone may not be enough for real audiophiles. Another headphone volume booster idea is to purchase an external portable DAC (Digital-to-Analogue Converter). They are not cheap, but they will increase both the volume and the audio quality from your smartphone to your headphones. Some of them will even connect to your headphones wirelessly. Two of our favorite portable DACs are the Chord Mojo and the Creative Sound Blaster X5. Connect to a Bluetooth or smart speaker. Adam Molina / Android Authority. Another way to increase the audio volume on your smartphone is to connect it wirelessly to a Bluetooth or smart speaker. This might be preferable for some people who don't want to use headphones or earphones, especially at home. People who want improved audio are safe in using a Bluetooth speaker. Our sister site, SoundGuys, is the place to look for the best Bluetooth speaker under \$50? Maybe you want the best one, regardless of price? If you want to add some extra features, getting a smart speaker like an Amazon Echo or a Google Home would be a good choice. There are plenty of options for someone who wants to boost their smartphone's audio, and the odds are good one or more of them will work for you. Have you tried any of these ideas, and if so, which ones have worked for you? Have you used any other method to boost your smartphone volume that we haven't mentioned here? Let us know in the comments. Read next: The best phones with a headphone jack. Pin the Volume Booster to the toolbar. After successfully downloading the Volume Booster, you need to pin this to the toolbar. To pin this, you need to navigate to the Extensions icon. Moreover, you will get the icon placed at the top-right corner of your browser. You must have been watching the pin button in the toolbar; simply click on it. Hence, here you will get your Volume Booster pinned to the toolbar. There's nothing more annoying than when you're talking hands-free and your phone speaker goes mute. If the speaker is not working on your Android device, there are a dozen troubleshooting techniques you can try to restore the volume. Instructions in this article apply broadly to all smartphones and tablets running the Android OS. Follow these steps to uncover the cause of the problem: Turn on the speaker. If you can't hear anyone on the other end during a call, check to see if the speaker is enabled. If it is activated, the speaker icon is green or highlighted. If it's not, tap the speaker icon so that it lights up to enable it. You can hear through the earpiece even if the speaker is disabled. Turn up the in-call volume. If the speaker is enabled, the volume may be turned down too low. Press the volume up button on your phone. This tends to be on the left side of most phones. Press this button to display the volume level indicator. To increase the volume, press the button or slide the volume indicator to the right until you hear the other person speaking. The only way to test and set the in-call volume is to be in a call. Make a test call to your voicemail to experiment with the in-call settings. Adjust the app sound settings. Some apps, such as Facebook, allow you to mute the sound separately from the main volume control. If you don't hear sound in one particular application, check the app's sound settings. You might have the sound muted or turned down low in the app. Check the media volume. If you still don't hear anything, verify that the media volume isn't turned down or off: Navigate to Settings > Tap Sounds and vibration > Tap Volume. Move the Media slider to the right to increase volume. Alternatively, press the volume up or volume down buttons on your device, then tap the down arrow in the upper-right corner of the screen to reveal the sound mixer settings. Make sure Do Not Disturb isn't enabled. This handy feature could be the culprit for no sound. To disable this setting, navigate to Settings and turn off the Do not disturb toggle. Android 6.0 (Marshmallow) displays the following options: Total silence, Alarms only, and Priority only. Make sure your headphones aren't plugged in. Most Android phones automatically disable the external speaker when headphones are plugged in. This could also be the case if your headphones aren't completely seated in the audio jack. Remove your phone from its case. Some phone holsters or cases may muffle the sound. Remove your Android phone from its case, then test the sound. You'll notice immediately if the sound improves. Reboot your device. A reboot often clears up any software glitches that may disable the sound. Press and hold the power button until you see a set of options on the screen. Tap Restart to reboot your phone. Turn off your device and turn it back on. If rebooting doesn't do the trick, your phone may have some technical issue that requires you to turn it off and on. Press and hold the power button, and then tap Power off. Once you power your phone back on, test the sound with an app. Reinsert the battery. Not all phone models have removable batteries, but if yours does, remove and reinsert the battery to completely reset the phone without wiping your data. Consult the cellphone manufacturer's manual or website for details. Clean the speaker. Speakers get dirty or clogged, so a bit of cleaning could make sounds clear again. Before you clean the speaker, turn off the phone and remove the battery. Use a can of compressed air to blow quick bursts into the speaker. You'll see some lint and other debris after blowing it out. You may be able to blow through the speaker without opening the case. Consult your phone's manual or a smartphone dealer for help with this process. Do not attempt to clean the speaker if you aren't familiar with smartphone hardware, or if your device is under warranty. Reset all settings. Before you take your phone back to the store, reset the phone to its default state. When you reset your phone's settings to the default, any app or software setting that may have disabled the speaker is eliminated. Check your device's manual. If the above tricks don't work, consult your device's documentation or the manufacturer's website for more specific guidance. Still having trouble? It might be time to throw down some dollars for a new Android. We've tested a lot of them; take a look at our recommendations to see what might work for you and your budget.
